

Black Mountain Power LLC and what it will cost Parker County

A data-center and gas-plant complex at FM 730 and Pearson Ranch Road — what we know, what it will cost, and what this court can do.

Henry Lee Butler

Prepared for the Parker County Commissioners Court · standalone data-center session, June 9, 2026

Revised September 1, 2026

Cost, water, Chapter 391, mitigation and the ask rebuilt. The June briefing is preserved unchanged at archive/2026-06.

Every number in this briefing traces to a public record. Sources are listed in each section and gathered in Sources & methodology. Interactive map and full data: github.com/Parker-Data-Pro-Populo/data-center-surface-datarun

Community opposition to the establishment of data centers in Parker County shouldn't be dismissed as uninformed 'NIMBY-ism.' Because we choose to stand against them isn't a rejection of data centers, but of process and impact — something is being imposed on the community that will directly compete with us for resources necessary for our survival, such as water and clean air. To have that imposition occur when we do not have a seat at the table — when monied interests and property rights are given a seat, but the citizens and human rights are checked at the door — is simply not acceptable.

It is possible that, when all the financial and environmental concerns are addressed and there is evidence of adherence to a plan that protects the citizens and the environment of Parker County, data centers will simply be a part of the landscape. But if the process is open and inclusive, we not only have built-in protections for our community, we have built a collaborative effort across the county, focused on the common good. This is a habit we must continue, because this will not be the last challenge our community will face.

The appraisal district just recognized the conversion

Parker County Appraisal District, May 15, 2026

On May 15 the appraisal district stripped the agricultural exemption from all 18 parcels at 501 Pearson Ranch Road. In plain terms: the county now officially treats this land as an industrial site, not a ranch — because that is what it is becoming.

The CAD issued **corrected notices** on all 18 parcels owned by Black Mountain Power LLC at 501 Pearson Ranch Road.

The notices **removed the agricultural exemption**. The parcels are no longer being valued as ranchland, because they are no longer being used as ranchland.

This is the appraisal district officially recognizing that the conversion has begun.

Annual property tax on the 18 noticed parcels:

\$6,482/yr

before the correction (under ag exemption)

\$943,097/yr

after the correction

Plus ~\$2.81 million one-time rollback tax owed (TX Tax Code §23.55, amended by HB 1743 in 2019 — 3 years of back-tax, plus 5% statutory interest)

Source: Parker CAD May-15-2026 corrected notices. See Sources & methodology.

About 2,081 acres, just outside the city's reach

501 Pearson Ranch Road, off FM 730 (Azle Highway)

The site was deliberately pulled out of Weatherford's jurisdiction and sits on top of the city's drinking-water watershed — so the people most affected have the least say over it.

- **18 parcels • 2,075.28 acres** under the May 15, 2026 corrected notices, assembled under *Black Mountain Power LLC* — plus a **19th adjacent parcel of 6.53 acres** from the same seller that received no notice, for an assembly of about **2,081 acres**
- Taxing units: Weatherford ISD, Parker County, Hospital District, Junior College District, ESD-1, Lateral Road
- **Removed from Weatherford's ETJ** — petitioned out, so the city has no land-use authority
- Inside the **Lake Weatherford watershed** — the city's drinking-water source
- ~2 miles from the northern City of Willow Park boundary
- ~1 mile from a proposed **\$1.5 billion equine development** the city has been planning for four years

Land value

\$58,347,790

total market value across all 18 parcels (Parker CAD 2026)

Earlier transactions

2025-06-03: Black Mountain Land Company LP transferred 172.78 ac to Black Mountain Power LLC

2025-2026: further parcels assembled under the same operator

2026-05-15: ag exemption stripped from all 18 parcels

One operator, multiple LLCs, one office

And a documented trail of political giving alongside a 2.5-week permit

The same person controls every entity involved — a land company that holds the dirt and a power company that holds the air permits — all run out of a single Fort Worth office. Six months before the permit cleared in 2.5 weeks, that company gave the Governor's campaign half a million dollars.

Rhett M. Bennett is the registered agent for every Black Mountain entity and a named member of Fort Worth Power Core LLC. All four entities operate from **425 Houston Street, Suite 400, Fort Worth, TX 76102**.

The structure separates the land arm from the power arm. The land arm holds the parcels. The power arm holds the TCEQ air permits and operates the gas turbines.

"Black Mountain is a power company. They're [an] oil and gas company that has land assets all over the state."

— Chris Strayer, Parker County EDC Director, on the record at the May 26 commissioners court session

Entity	TX SOS file	Formed
Black Mountain Land Company LP	0801708440	2012-12-28
Black Mountain Royalty LP	—	(earlier)
Black Mountain Power LLC LAND ARM	0805989692	2025-04-11
Fort Worth Power Core LLC POWER ARM	0805493020	2024-04-03

Registered agent for all entities: Rhett M. Bennett. Registered agent for the power-arm legal filings: Stubbeman McRae Sealy Laughlin & Browder (Midland TX, Permian Basin energy counsel).

DOCUMENTED POLITICAL ACTIVITY — EVERY LINE FILED WITH THE TEXAS ETHICS COMMISSION

\$500,000	Black Mountain Power LLC → <i>Texans for Greg Abbott</i>	Nov 14, 2025	TEC report #101029815
\$500,000	Bennett → <i>Texans for Greg Abbott</i>	Mar 6, 2026	TEC report #101055764
\$36,750	Bennett → <i>Texans for Greg Abbott</i>	Oct 23, 2024	TEC report #100987892
\$10,000	Bennett → <i>Sen. Phil King</i> (SD-10, Parker County)	Sep 30, 2025	TEC report #101026985
\$10,000	Bennett → <i>Sen. Phil King</i>	Sep 26, 2024	TEC report #100970637
\$46,000	Bennett → eight Fort Worth council members and the Mayor	2025	during zoning approvals

\$1,036,750 to the Governor's committee across three gifts, and **\$20,000 to Parker County's state senator**. A further **\$30,000** went to Rep. Ken King of HD-88 — relevant here only because he chaired the House State Affairs Committee for the interim hearing on data centers (TEC reports #101028141, #101035143, #101058003).

TCEQ registration #179422 was approved in **~2.5 weeks**, with no public process.

What we are not claiming. Nothing here shows that any contribution bought any decision, and we have no evidence of one. Note also what cuts against that reading: on August 3, 2026 the same Governor froze data-center interconnections statewide pending an audit. These are filings, dates and amounts — the public record of who is spending what, and nothing more.

A name note, so the arithmetic can be checked. The CEO appears in TEC filings as both "Rhett Bennett" and "John Bennett," each at Fort Worth addresses with Black Mountain employers and Founder/CEO or Chairman occupations. A 2018 filing under the full name *John Rhett Miles Bennett* (Black Mountain Oil & Gas, CEO) ties the two forms together. Totals combine them; every line above remains separately citable.

Parker is one site in a statewide rollout

Fort Worth Power Core LLC • 14 sites • ~5,800 MW • 26 months • one address

This isn't a one-off local project. The same operator has registered 14 gas plants across Texas in just over two years. Four are tied to data centers; the other ten are registered as merchant grid generation, not tied to a specific data center. Parker drew the developer's attention as the Fort Worth campus ran into resistance.

Fort Worth Power Core LLC — 14-site statewide gas-plant network

One operator, 11 counties, 14 sites. Parker is one of fourteen. Hill • Hood • Hays — conspicuously absent.

A power plant approved in 2.5 weeks, with no public process

5 gas turbines · 24/7 continuous operation · capacity stated in testimony as ~75 MW, not in the permit record

Texas has a slow permit path with public hearings, and a fast path with none. This plant took the fast path — approved in two and a half weeks, with no chance for anyone to comment or object.

TCEQ regulated entity	RN112172408 "PARKER PLANT"
Permit number	Air New Source Registration #179422
Permit type	Standard Permit / Permit-by-Rule fast-track
Status	ACTIVE
Holder	Fort Worth Power Core LLC
Approval timeline	2.5 weeks (vs ~9 months for the City of Weatherford's recent wastewater permit)
Public-notice process	None
Operating hours	Continuous (24/7)

What "Standard Permit" means

TCEQ has two air-permit paths:

- **New Source Review (NSR):** full technical analysis, 30-day public notice, contested-case hearing available. Takes 6–18 months.
- **Standard Permit / Permit-by-Rule:** pre-approved authorization templates. Minimal or no public notice. Takes days to weeks.

The fast-track is legal. But it means the public did not have the opportunity to comment, request a contested-case hearing, or examine the emissions inventory.

"That permit was approved without any type of public process, which to us was kind of shocking."

— James Hotopp, Weatherford City Manager, May 26, 2026

Sources: TCEQ Central Registry · May-26-2026 commissioners court transcript.

Phase 1: five turbines, and a number that is not in the permit

Corrected September 2026 — the county has since refused abatements, and the scale was never filed

TCEQ Air New Source Registration **179422** (RN112172408, "Parker Plant," 501 Pearson Ranch Road) authorizes **five natural-gas turbines** described as backup and bridge power for a data center. That is the permitted fact. The **75-megawatt** figure attached to it — including by this site in June — comes from **testimony**, not from the permit: it was stated in open court on May 26, 2026 that "there has been [a] 75 megawatt power plant that's been approved for this particular site... approved for continuous operations, which means it can run 24 hours a day."

We went looking for the filed number and did not find one. TCEQ's Central Registry entry for Registration 179422 shows status, holder and address — **no capacity** — and the agency's Central File Room returns no public documents for it. The registration's terms require a records request to TCEQ Air Permitting. Until that comes back, this row stays labelled **TESTIMONY**.

*The same operator's Bowie County plant — filed February 2026 under the same standard permit for electric generating units — discloses roughly **446 megawatts**.*

Fort Worth Power Core LLC, RN112380654 · reported June 29, 2026

That cuts both ways, and it is why we no longer treat 75 MW as a ceiling. These registrations *do* state capacity; this operator's other one states a number nearly six times larger. What Parker's says is a question with an answer on file somewhere — it simply has not been published.

The turbine class is unsettled in the same way. Our own June working file describes the registration as five **Siemens SGT-400** units at 15 MW each — which is where 75 MW comes from — but that description carries no citation and we have not been able to confirm it. Meanwhile three of this operator's Tarrant County registrations are named for a larger machine, the **SGT-800**, rated roughly 45 to 62 MW. Five of those would be 250 MW or more. **We assert neither**. We are pointing at the gap: the difference between 15 MW units and 50 MW units is a factor of three in every number downstream, and it is settled by one document that has not been published.

If it is built and not abated, this is who collects — every year

Weatherford ISD is the largest recipient at every scale and the one a county abatement cannot touch: Tax Code 312.002 bars school districts from Chapter 312, and JETI (Gov't Code Ch. 403) excludes data centers. The five gas turbines are the one JETI-eligible asset on the site — dispatchable generation, not the data hall. Note the axes differ: these scenarios are orders of magnitude apart.

If it is built and not abated, this is who collects. Note the axes differ — the three scenarios are orders of magnitude apart.

What changed: in June this section said Phase 1 would cost the county about \$30 million, assuming an 80% Chapter 312 abatement. On June 30, 2026 the Commissioners Court stated on the record that **Resolution 26-25** forecloses that assumption — *"there will be zero tax abatements for data centers in Parker County."* The baseline therefore inverts.

\$3.8M/yr

collected — county + hospital + junior college + ESD-1 + lateral road, unabated

\$38 million

over ten years, at the Phase 1 improvement value of roughly \$750 million

Plus Weatherford ISD: \$6.6M/yr, \$66M over ten years — and a county abatement cannot touch it. Tax Code §312.002 bars school districts from Chapter 312 entirely, and JETI (Gov't Code Ch. 403) *excludes data centers* by NAICS code. The one JETI-eligible asset on the site is the generation — the turbines, not the data hall.

The land is already producing. After the May 15, 2026 corrected notices, the 18 parcels pay about **\$943,000/yr** against roughly \$6,500 under the agricultural valuation, plus about **\$2.8 million** of rollback tax — three years plus 5% interest, Tax Code §23.55 as amended by HB 1743 (2019).

What 75 MW now means at the state level: SB 6 (2025) defines a **large load as 75 MW or more.**

Anything at that scale interconnecting after December 31, 2025 must carry equipment allowing ERCOT to curtail it directly during firm load shed, and moves through ERCOT's Batch Zero process — which Governor Abbott's **August 3, 2026** directive froze pending a verification audit of every data center in the queue. This project sits exactly on that threshold.

What is not known is itself the finding. As of today there is *no* data-center permit application on file with Parker County, *no* disclosed capacity for the Parker site, and *no* announced ERCOT queue position. Weatherford has said data centers "remain NOT ALLOWED" inside the city; the site is roughly seven miles northeast of downtown, outside its reach.

The state does not have these numbers either — which is why the August 3 directive requires every project in the interconnection queue to file its incentives, power draw, water use, mitigation measures, and ownership.

ERCOT is working to complete that audit by December 10, 2026. That filing, not an extrapolation, is where a defensible buildout number will come from.

What a county refusal does and does not reach: Resolution 26-25 binds no future court and does not bind the hospital district, the junior college, ESD-1 or the lateral road fund, each of which grants its own Chapter 312 agreement. And it reaches nothing at the state level: Tax Code **§151.359** exempts a qualifying data center from state sales tax on servers, cooling, electrical gear and *the electricity itself*; **§151.3595** extends that to local sales tax for twenty years at a \$500 million investment with 40 jobs and 20 MW of contracted transmission.

And the Governor cannot reach them either. Those exemptions are statutes. They are administered by the **Comptroller** — a separately elected officer, not a gubernatorial appointee — and only the Legislature can repeal them. The Governor has named repeal a **2027 legislative priority**, and the Senate Finance chair has said she will file a bill; there was no regular session in 2026. Until then the statutes stand.

What can actually claw the money back is an audit, and audits are the thin part of the system. **138 data centers are certified** — 59 of them in 2026 alone, arriving at roughly ten a month — and **20 have been audited**. Of those twenty, **six were out of compliance**: four failed the job requirement, one the square-footage floor, one self-reported a broken power agreement. A facility found non-compliant must repay the taxes it was excused. The state put the two-year cost of the exemptions at **\$3.2 billion** in 2025, and its chief revenue estimator has said the next estimate will be significantly higher.

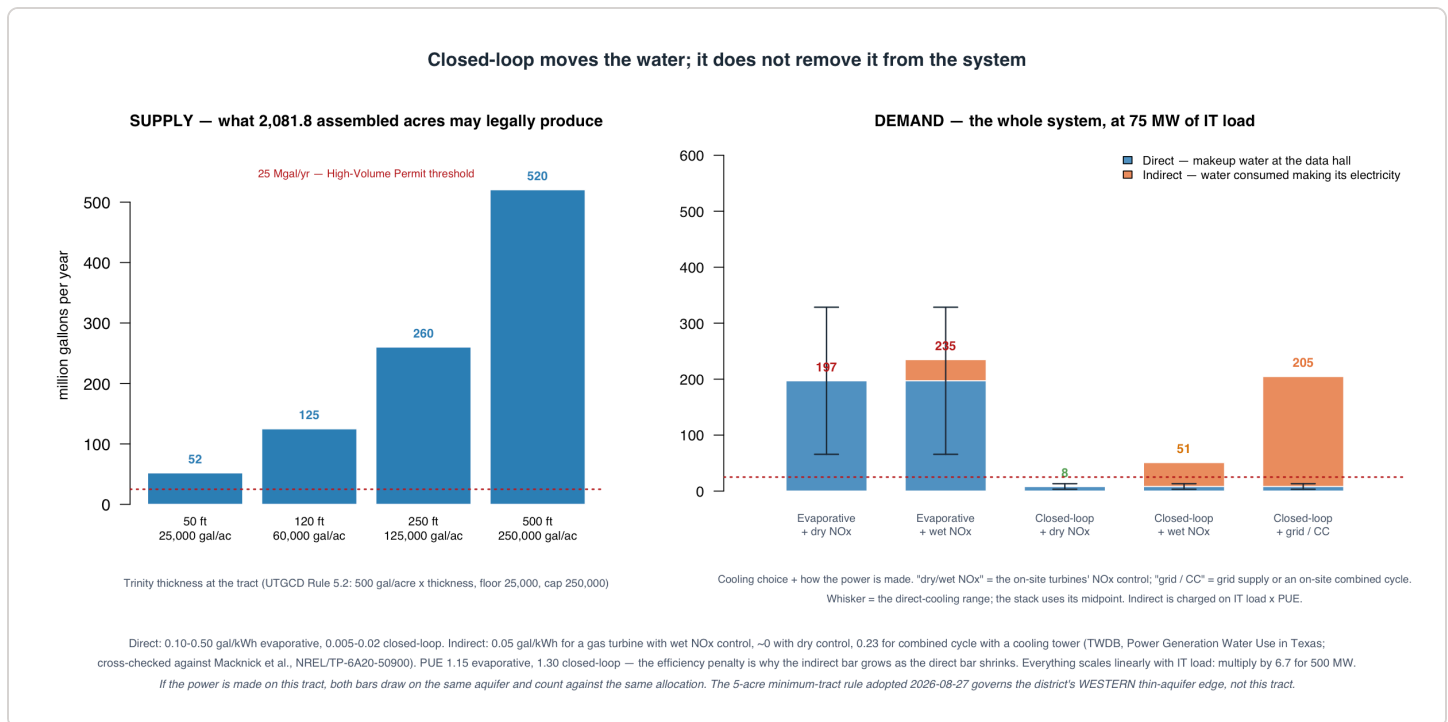

So the honest sequence, if this project is built at scale: the county has refused what it controls, the Governor is asking the Legislature for what he does not control, and the only live check on the largest subsidy is a compliance review running at fourteen percent.

Improvements taxed at 85% of value; 2025 adopted rates; 10-year Chapter 312 term. Evidence classes: PERMIT (filed public record), TESTIMONY (stated on the record by an official), DISCLOSED (announced by the developer for another site), INFERRED (derived from acreage; no filing supports it). Model: profile_2026_09/RCO_05g_scenarios.R · data: profile_2026_09/scenario_table.csv.

Count the whole system, or the water just moves where nobody is looking

Upper Trinity GCD rules adopted August 27, 2026 — and the water behind the power

Public comment on this project has cited five million gallons a day. That figure is not sourced, and it is not necessary. The Upper Trinity Groundwater Conservation District — Hood, Montague, Parker and Wise — adopted amended rules on **August 27, 2026** that make the water question arithmetic rather than rhetoric.

Left: what the tract may legally produce, by Trinity thickness. Right: total system demand at 75 MW of IT load — cooling makeup water plus the water consumed generating the power. Same axis; the dotted line is the High-Volume Permit threshold.

Production is capped by acreage. Under Rule 5.2 the annual allocation is 500 gallons per contiguous controlled acre times the aquifer thickness in feet, floored at 25,000 and capped at 250,000 gallons per acre. Across about 2,081 acres that is roughly **52 to 520 million gallons a year** — about 0.14 to 1.4 million gallons a day — with the exact figure set by the Trinity thickness at the tract.

But cooling is only half the system. A closed-loop design does not make the water disappear; it moves it upstream to wherever the electricity is generated — and because closed-loop rejection is less efficient, it raises the power draw that carries that water. At ~75 MW of IT load, an evaporative hall consumes about **197 million gallons a year** at the site. A closed-loop hall consumes about **8 million** at the site — but **205 million** once you add the water consumed generating its power on a combined-cycle or grid supply. That is the same number, relocated. Counting only the cooling tower is how a project gets called water-neutral.

And it forces the public process the air permit skipped. Any operating permit of **25 million gallons a year or more** in the Trinity is a High-Volume Permit Application: hydrogeologic investigation, aquifer testing, enhanced notice to nearby landowners, and a contested-case hearing any person in the district may request.

Production aggregates across a well system, so a campus cannot be split into small permits to stay under it. Every scenario on this chart clears that threshold.

And here the two halves collapse into one. This project proposes to make its own power *on the tract*. If it does, the indirect water is local water too — same aquifer, same district, counted against the same allocation. Whether the turbines use **wet NOx control**, which evaporates roughly 0.05 gallons per kWh generated, or dry control, which uses almost none, is therefore a groundwater decision buried inside an air permit that was issued in two and a half weeks with no public process.

One thing this section does not claim. The district also raised the minimum tract size for new wells from two acres to five where the Trinity runs 60 feet thick or thinner, effective January 1, 2027. That trigger is on the district's *western* edge. The Black Mountain tract is northeast of Weatherford. The rule matters to rural landowners and to district-wide tightening — it is not a constraint on this tract, and we will not present it as one.

*Sources: UTGCD proposed rules amendments for the August 27, 2026 hearing — Rule 4.3(h) minimum tract size, Rule 5.2 production allocation, Rules 2.10–2.12 high-volume applications, Rule 2.13 aggregation — read together with the district's signed agenda for that date, which carried "possible action on adopting proposed amendments to District Rules" · Commissioners Court resolution of June 9, 2026 · cooling band direct cooling 0.10–0.50 gal/kWh evaporative and 0.005–0.02 gal/kWh closed-loop; generation water 0.05 gal/kWh for a gas turbine with wet NOx control, negligible with dry control, and 0.23 gal/kWh for combined cycle with a cooling tower (TWDB, *Power Generation Water Use in Texas*, cross-checked against Macknick et al., NREL/TP-6A20-50900); PUE 1.15 evaporative and 1.30 closed-loop; × 8,760 hours. Configuration table at [profile_2026_09/water_system_configs.csv](#). **Two verification notes:** as of September 1, 2026 the district's posted rules PDF is still the February 22, 2021 version, so the adopted text is quoted from the proposed amendments; and the site-specific ceiling awaits the Trinity thickness at the tract, which the district's own Tract Size Requirements Map and its newly commissioned local groundwater flow model will settle.*

And the county can't simply tax its way back

HB 3 and SB 2 cap how fast local government can raise revenue

It's natural to assume the county could recover this over time by adjusting rates. State law sharply limits that. An abatement isn't a gap that closes later — it's a lasting reduction in what the county can fund, even as the project adds new demands to the same budget.

Two laws the Texas Legislature passed in 2019 cap how fast local jurisdictions can raise revenue without sending it to an election:

- **HB 3** — limits Weatherford ISD revenue growth without a voter-approval election
- **SB 2** — caps county and special-district revenue growth at 3.5% without a voter-approval election

Because of these caps, the county cannot raise its rate enough to recover revenue of this magnitude. In practical terms the abated amount is **permanent** — it does not return as a higher bill on other residents, and it cannot be recouped later.

Two things are true at once

The county **cannot recover** the foregone revenue by raising rates — state law caps how fast revenue can grow.

The project still **adds real costs** to the existing budget — emergency response for an industrial site, road wear, water-system load, the demands of growth — while only one-fifth of its value is taxed to offset them.

The gap between what the project costs the county and what it pays falls on the budget everyone already funds. *The specific cost categories and dollar figures are being compiled.*

Statutory anchors: TX HB 3 (2019, school finance) · TX SB 2 (2019, property-tax reform). Service-cost figures forthcoming.

The site choice tells the developer's story

Cheap rural land, light regulation, close to existing infrastructure

Developers pick sites by a simple formula: available land, light regulation, and nearness to power lines. Parker's own rules already make it a hard target — but the region's infrastructure was attractive enough that the company decided the local fight was worth it.

Dark red = highest developer attractiveness (land × permissiveness × infrastructure proximity).

The siting-risk index combines:

- Available rural land (low cropland share)
- Regulatory permissiveness (GCD, PGMA, moratorium status)
- Proximity to existing data-center / grid infrastructure

Parker's current rank: 237 of 254 Texas counties.

Our regulations and Hill's moratorium have measurably lowered Parker's score. But the regional clustering still made us attractive. The developer's calculation was: *worth the local political fight here, versus siting somewhere with less infrastructure.*

Hill County (after passing the moratorium): rank 191. Hood: rank 245. Hays: rank 252. Without the regulations, Parker would be near the top quartile.

Index: 0.35·land + 0.35·permissive + 0.30·infrastructure-proximity. See Sources & methodology.

The ledger of what worked, what got reversed, and what got sued

At least 100 local data-center ordinances have been considered in Texas since July 1, 2025. The outcomes are not random.

The June version of this slide had three examples and a guess. Here is the fuller record, because the pattern in it is the single most useful thing Parker County can learn from: **land-use prohibitions by counties get reversed; conditions, permits and money decisions hold.**

Reversed under legal pressure

Hill County — one-year moratorium on data-center construction in unincorporated areas, May 2026. **Rescinded within weeks** after a developer sued for more than \$100 million; replaced with developer requirements.

Tom Green County — abandoned its moratorium plans after watching Hill County.

Hood and Hays Counties — considered moratoriums in February 2026; neither adopted one under threat of suit. Hood has instead **denied plats** and is now in litigation over it.

Standing, so far

Austin County — countywide moratorium on new AI data centers and battery storage, July 2026.

El Paso — 300-foot minimum separation from residential, noise mitigation, special-use permit, July 2026.

Forney — light-industrial zones only, 1,000-foot residential buffer, April 2026.

Lewisville — special-use permit plus two mandatory public hearings, June 2026.

Mesquite — dedicated data-center and BESS framework, July 2026.

All four are *cities* exercising zoning authority under Local Government Code Ch. 211 — the tool Parker County does not have.

Being tested right now

San Marcos — first Texas city to define data centers in its zoning code and make them ineligible citywide, June 2026. State Sen. Paul Bettencourt has moved to challenge it under HB 2559 (2025) and HB 2127 (2023); land-use lawyers counter that HB 2559 reaches moratoriums, not zoning changes.

Milam County — resolution urging stricter statewide standards. **Delta County** — Chapter 391 commission by interlocal agreement with two cities and its soil and water conservation district. **Erath–Somervell** and **Hood–Somervell** — 391 sub-regional commissions formed.

Why the reversals happen — the mechanism, not the mood: HB 2127 (2023) added **Civil Practice & Remedies Code Ch. 102A**. Any person — or a *trade association* representing one — who sustains an injury "actual or threatened" from a county ordinance that violates the preempted codes may sue. Governmental immunity is waived. The claimant recovers attorney's fees on winning; the county recovers fees only if the suit was frivolous. That asymmetry, plus association standing and the sufficiency of a merely threatened injury, is what a \$100 million demand letter is built on. **Note what did *not* happen:** SB 2858 (89R, 2025), which would have added an attorney-general enforcement track and let the comptroller withhold a county's sales-tax funds, **died in House Calendars**. The teeth today are private suits only.

Chapter 391: a table with chairs at it, and a statute that says the state has to sit down

What a sub-regional planning commission actually does — and the two routes in front of this court

A Chapter 391 commission is created by nothing more than matching resolutions from the participating counties (§391.003). Its region must fit the planning regions the governor has already delineated (§391.003(b)(2)) — it is not free-form. What it buys is **coordination and visibility**: the power to plan and recommend (§391.004), to receive and comment on state and federal grant and loan applications from governmental units in the region before they are filed (§391.008), and to be the regional entity state agencies consult (§391.0091).

What it is not

- **No power to tax** or levy assessments (§391.011) — it runs on member dues and contracts
- **No zoning or regulatory power** over private property, and it does not enlarge the authority any member county already has
- **Advisory only** — a plan has effect in a county only if that county's court adopts it (§391.004(b))
- **Ongoing overhead** — annual independent CPA audit and reporting to the State Auditor (§391.0095); non-compliance can bring a governor-appointed receiver or withheld funds
- Members may withdraw by majority vote of their governing body (§391.015)

Stated plainly in open court on July 13, 2026: a 391 is "perception of doing something without actually accomplishing the main goal, which would be to stop data centers... What it does do is delay the process and provides more hurdles."

The two routes

Route A — a new Parker–Hood sub-regional commission. Drafted July 8, 2026 and scoped narrowly: a ten-member board, at least two-thirds elected officials, five seats for Parker, ex officio seats offered to legislators in the region, and a subject-matter *exclusion* limiting it to data centers and their direct impacts. Its definition of "Data Center" deliberately reaches hyperscale, AI/HPC, colocation and crypto facilities *and* the generation, transmission, substation and water infrastructure built principally to serve them.

Route B — work inside the 391 Parker is already in. The North Central Texas Council of Governments is itself a Chapter 391 commission. Judges in Johnson and Erath Counties want a consensus built inside the COG, and NCTCOG administers roughly \$2 billion in regional transportation funding — leverage that cuts both ways. As of July 13 the county had no local partner secured for Route A, and one commissioner had floated the City of Weatherford instead.

The court's own concern was pace: "when they meet in August they'll talk about what they need to meet about in September." Meanwhile the Upper Trinity GCD has appeared at two court sessions — and it holds the one authority in this picture that HB 2127 did not preempt.

documented here.

The money lever has already been pulled. The water lever has not.

Revised September 2026 — the June version of this slide asked for something the court has since done

In June this slide argued that the abatement vote was the lever and the window was open. The court closed that window itself: **Resolution 26-25** declines abatements for data centers, and on June 30 the court put it beyond doubt — "there will be zero tax abatements for data centers in Parker County." On June 9 it also resolved against open-loop evaporative cooling and high-volume potable-water use. Both are real, and both are now the baseline of our model rather than an ask.

Already done

- **Resolution 26-25** — no Chapter 312 abatements for data centers
- **June 9 resolution** — opposing open-loop evaporative cooling and high-volume potable water; urging closed-loop, reclaimed and non-potable sources, and demand-response participation
- Data centers made a **standing agenda item**, with evening sessions added for residents who work days
- TCEQ, ERCOT and PUC representatives **invited to appear** at the June 9 session

Still open — and not preempted

- **Water.** Participate in Upper Trinity GCD proceedings; any high-volume permit here is contestable at SOAH by any person in the district. Water Code Ch. 36 was untouched by HB 2127.
- **Roads.** Road-use and infrastructure agreements as a condition of construction traffic
- **Plat and floodplain.** The subdivision process and county flood-hazard permits
- **Records.** A public-information request, through the county attorney, for the TCEQ registration file — the capacity number missing from every public surface
- **Air.** Parker County sits in the DFW 8-hour ozone nonattainment area, classified **Severe**, where the major-source NOx threshold is 25 tons per year (30 TAC §116.12, Table I). A plant permitted as "backup/bridge power" but testified to run continuously is worth asking TCEQ about in writing, in correspondence prepared by the county attorney.
- **Coordination.** The 391 decision, and contact with the other counties where this operator holds air permits

Still outside the county's reach

- Zoning — Parker has no Ch. 231 grant, unlike Hood County
- A land-use moratorium — see Hill County, and Ch. 102A
- TCEQ air permitting; the agency reads Health & Safety Code §382.0518(b) as requiring it to grant a complete application
- ERCOT interconnection and the state's Batch Zero process
- City zoning — Weatherford has said data centers "remain NOT ALLOWED," but the site is outside the city

- **State incentives.** Tax Code §151.359 and §151.3595 exempt qualifying data centers from sales tax on equipment, cooling, and electricity. A county resolution reaches none of it.

And one limit worth stating honestly: a resolution binds no future court, and it does not bind the hospital district, the junior college, ESD-1 or the lateral road fund — each grants its own Chapter 312 agreement.

Tex. Tax Code Ch. 312, §§151.359, 151.3595 · Tex. Water Code Ch. 36 · Tex. Civ. Prac. & Rem. Code Ch. 102A · Tex. Health & Safety Code §382.0518(b) · Commissioners Court transcripts, June 9, June 30 and July 13, 2026 · UTGCD rules.

Seven actions still open to this court

Revised September 2026 — the asks that mattered in June have been adopted. These are what is left.

The June version of this slide asked the court to refuse abatements and to make data centers a standing public agenda item. **It did both** — Resolution 26-25 and the June 9 water resolution are on the record, and the evening sessions happened. What follows is not a repeat. Each item below is something no one has done yet, none require new statutory authority, and none run through the land-use route that has cost Hill County and Hood County so dearly.

On correspondence: several of these asks involve writing to agencies outside county government — TCEQ, the PUCT, ERCOT, the groundwater district. **Any such communication should be drafted, reviewed and sent by the county attorney.** This project can supply example language and the underlying citations as a starting point, and is glad to. It does not offer a final draft, and takes no responsibility for what is ultimately sent. The county speaks for itself.

In fairness to this court: campaign-finance filings show **no contributions to any member** — Judge Deen or Commissioners Conley, Holt, Walden, or Hale — from Black Mountain, Fort Worth Power Core, or Bennett. That is not an assumption: all 234 campaign-finance reports posted by Parker County for 25 elected officials, 2021–2026, were pulled and machine-read, and searched against 30 entity patterns covering the Black Mountain ecosystem and 27 other data-center actors. **Zero matches in any donor field.** The 22 surface hits were all expenditures or false positives — including a payee named Jeff Bennett, no relation, and a street called Bennett Road. The documented giving went to state and city officials, not to this county. This request is not an accusation.

1. Direct the county attorney to inquire with TCEQ, and to request the registration file. The question the record cannot answer: Parker County sits in the DFW **Severe** ozone nonattainment area, where the major-source NOx threshold is **25 tons per year**, not 250 — was Registration 179422 evaluated against that threshold, and against the continuous operating profile testified to on May 26, rather than the "backup/bridge power" characterization in the application? Pair it with a public-information request for the full registration file. *The permitted capacity of this plant does not appear on any public surface.* The Central Registry entry has no capacity; the Central File Room returns no documents. That number should not be something a citizen has to infer.

2. Amend the June 9 water resolution to cover total system water. As written it opposes open-loop evaporative cooling. That is right but incomplete: a closed-loop hall drawing combined-cycle or grid power consumes about **205 million gallons a year at 75 MW** — essentially the same as an evaporative hall, just consumed where the electricity is made. The resolution should state the county's standard as **total water per unit of computing — cooling plus generation**, so that a project cannot satisfy it by moving the water upstream.

3. Put Parker County on the record with the Upper Trinity GCD. Through the county attorney, three specific requests: a standing request for *notice of every high-volume permit application* filed anywhere in the county; a stated intent to seek a *contested-case hearing* if one is filed for this tract; and a request that the district require *whole-system water disclosure* — cooling and on-site generation together — in any high-volume application. The district's rules are the one authority in this picture that HB 2127 did not preempt, and the district is already building a local groundwater flow model that will settle the thickness question at this tract.

4. File with the PUCT and ERCOT before the audit closes. Every data center in the interconnection queue must now report its incentives, power draw, water use, community mitigation and ownership; **ERCOT is working to finish by December 10, 2026.** Parker County should ask, in writing and through the county attorney, for two things: that results be published at *county level* rather than aggregated statewide, and that water be reported as a whole-system figure. The RFI currently collects cooling technology and power sourcing in separate boxes — nobody upstream is adding them together. While the county is writing, the Comptroller is the other address worth a letter: certification under §151.359 or §151.3595 is auditable, six of the twenty audits done so far found non-compliance, and a county can ask that a facility in its jurisdiction be reviewed.

5. Settle the Chapter 391 question with a date certain. Either route is defensible — a Parker–Hood sub-regional commission, or working inside the North Central Texas COG, which is itself a 391. What is not defensible is the drift this court named in open session on July 13: a meeting in August to decide what to discuss in September. Direct the County Judge to return a recommendation and a draft interlocal agreement by a specific date. Intergovernmental contact with the other counties where this operator holds air permits — Bell, Bowie, Carson, Cherokee, Fannin, Hale, Jack, Somervell, Tarrant, Wheeler and Williamson — should run through the judge's office with the county attorney's review of anything put in writing.

6. Extend the no-abatement position to the units it does not reach, and set the terms for what does get built. Resolution 26-25 binds neither a future court nor the *hospital district, junior college, ESD-1, or lateral road fund* — each grants its own Chapter 312 agreement. Ask each to adopt the same position. And adopt now, before construction traffic, a policy requiring a **road-use and infrastructure agreement with financial assurance** as a condition of any development at this scale. That is an ordinary county power, it survives the preemption cases, and it is far easier to require before a project breaks ground than after.

7. Adopt decommissioning terms now, and attach them to anything the county signs. Texas already requires this of other energy infrastructure. Utilities Code **Ch. 301** (wind), **Ch. 302** (solar) and, as of September 1, 2025, **Ch. 303** (battery storage) require removal obligations and financial assurance in the landowner agreement — equipment, transformers, substations and cables pulled *to at least three feet below grade*, holes filled with like soil, roads removed, land restored to tillable condition and reseeded, with the cost set by an independent Texas-licensed engineer. **Data centers and their on-site generation are covered by none of it.** The county cannot impose this by ordinance — that is the land-use route that got Hill County sued — but it can adopt these terms as policy and require them in every instrument it does execute: a road-use agreement, any utility or right-of-way consent, and any future incentive agreement. Ask UTGCD to require the well-plugging piece, and ask the delegation to close the statutory gap in 2027.

The parameters. "Pre-data-center state" is only enforceable if it is defined before construction:

- **Baseline first.** No ground disturbance until a pre-construction condition survey is filed with the county and escrowed: topography and drainage, soil profile and compaction, agricultural classification, vegetation, an inventory of every water well with static levels and water quality, and a dated photographic record. The bond restores the property to *that document*.
- **Removal to agricultural depth, not the statutory minimum.** All above-grade structures; all foundations, slabs, piers, buried conduit and piping to **at least four feet** — below normal tillage and root zone, not the three feet the storage statute allows; overhead lines, fencing, security lighting, access roads, culverts and laydown yards.
- **Soil and water made whole.** Testing and remediation for hydrocarbons, dielectric fluid and coolant at every transformer, turbine and fuel-handling location; all water wells plugged to TDLR and UTGCD standards; original contours and drainage restored; soil decompacted to **18–24 inches**; a minimum **12 inches** of certified clean topsoil replaced; reseeded to a native or agriculturally appropriate mix with noxious-weed control through **three growing seasons**.
- **Amount, with the loophole closed.** Full cost of removal, restoration, recycling and disposal, estimated by an independent Texas-licensed professional engineer, **with no salvage-value credit** — the offset the state statutes permit is exactly how these funds come up short when scrap prices fall. Escalated annually to a published construction cost index and recalculated every five years.
- **Posted before the risk, not after it.** Security in place *before ground disturbance for each phase* — not at year 10 or year 15, as the battery statute allows. Cash escrow, irrevocable standby letter of credit, or a surety bond from a Treasury Circular 570 surety. **No parent-company guarantees and no self-bonding**, the mechanisms that left coal reclamation unfunded elsewhere.
- **Triggers and deadline.** Twelve consecutive months of non-operation without written extension, abandonment, bankruptcy, or lapse of the air registration; restoration complete within **eighteen months** of the trigger.
- **It has to survive the owner.** Recorded as a covenant running with the land, binding successors and assigns; any transfer conditioned on the buyer posting equivalent security first. Annual certification of operating status, county right of inspection, and release of the bond only after county-verified restoration and two growing seasons of established vegetation.

None of these require new statutory authority. Items 1 and 4 are letters; 2, 6 and 7 are resolutions and contract terms; 3 is a filing with a district the county already sits inside; 5 is a scheduling decision. What is deliberately absent: any moratorium, plat denial, or land-use prohibition — the routes that produced a \$100 million claim against Hill County and litigation against Hood County under Civil Practice & Remedies Code Ch. 102A. Decommissioning model: Tex. Util. Code Ch. 301 (HB 2845, 2019), Ch. 302 (SB 760, 2021), Ch. 303 (HB 3809, 2025) and the HB 3228 amendments adding recycling and disposal costs to the assurance formula — with the salvage-value offset and the deferred posting deadline deliberately not carried over.

Don't take my word for it — check the map

Every county, every layer, every source

All of this is built on public data you can examine yourself. The interactive map lets you click any Texas county and see the numbers behind it.

- Toggle the **RCO surface** — where data-center resource competition is most intense in Texas
- Toggle the **MW concentration** — where the operating fleet sits today
- Toggle the **Fort Worth Power Core network** — the 14-site rollout
- Toggle **GCD coverage** — where groundwater regulation exists
- **Click any county** for source-cited detail

↗ Open the interactive map

A single self-contained HTML file. Works offline. Share it.

What it answers

- How does Parker compare to Hill, Hood, Hays?
- Where is the rest of the Fort Worth Power Core network?
- Which counties have GCDs and which don't?
- How much operating capacity does each county already have?

All source data on GitHub:
github.com/Parker-Data-Pro-Populo/data-center-surface-datarun

Every number traces to a public record

If a source is wrong or the math is off, it gets corrected with a dated note

Data sources

- **Parker County Appraisal District** — May-15-2026 corrected notices (18 parcels)
- **pg01.parker_property** — Parker CAD certified roll, tax rates, parcel ownership
- **TCEQ Central Registry** — Regulated Entity + Customer search, pulled 2026-06-01
- **TX Comptroller franchise-tax registry** — pulled 2026-06-01
- **TX Comptroller Chapter 312 / JETI registries** — pulled 2026-06-01 (Black Mountain: *no filings*)
- **TWDB Nov-2019 GCD shapefile** — 101 districts, 254 counties, spatial join
- **USDA NASS Census of Agriculture 2022** — cropland share
- **TX Comptroller Registered Qualifying Data Centers** — operating fleet
- **Parker County Commissioners Court** — May-26-2026 session transcript
- **Texas Ethics Commission** — bulk export loaded to Postgres (35.9M contribution rows), current through the July 15, 2026 filing deadline. Reports #101029815 and #101055764 (the two \$500,000 gifts to Texans for Greg Abbott), #100970637 and #101026985 (Sen. Phil King), #101028141, #101035143 and #101058003 (Rep. Ken King). Query and extract archived at `profile_2026_09/tec_black_mountain_query.sql` and `tec_black_mountain_contribution_s.csv`. First \$500,000 also confirmed by Texas Tribune (Jan 15, 2026).
- **Fort Worth Report / KERA News** — political-contribution records; \$10B FW campus stall; Fort Worth City Council Jun 23 vote
- **TCEQ turbine permit list** — 14 FWPC registrations, archived as `parker_costs/fwpc_sites.csv`. *Correction, Sept 2026*: the spreadsheet of MW ratings this slide previously cited is not archived in the repository and its Parker figure could not be re-sourced; the site list is.
- **ERCOT / PUCT** — SB 6 large-load framework, Batch Zero, and the August 3, 2026 audit directive. No Parker queue position has been announced.
- **Upper Trinity GCD** — proposed rules amendments for the August 27, 2026 hearing and the district's signed agenda for that date
- **Parker County Commissioners Court** — session transcripts of June 9, June 22, June 30 and July 13, 2026 (Resolution 26-25; the open-loop cooling resolution; the Chapter 391 discussion)

Methodology

Revised September 1, 2026. The model no longer produces a single figure. It takes taxable improvements (data-center capex at \$8M/MW plus gas turbines · 85% taxable share) and reports a **grid**: five scale scenarios against three abatement states, each row labelled with the class of evidence its scale rests on. The baseline column is **no abatement**, following Parker County Resolution 26-25. The 80% column is retained so the June 2026 figures remain visible and checkable rather than quietly deleted.

Weatherford ISD is now reported **alongside** the local jurisdictions instead of being set aside. Chapter 312 never reached school districts (Tax Code §312.002), and **JETI excludes data centers by NAICS code** — so the ISD levy on a data hall is not abatable by anyone. Dispatchable generation *is* JETI-eligible, so the turbines and the data hall are

modelled as separate improvement pools. **Per-household figures have been retired:** dividing a scenario by 46,404 households produced a number that read like a bill.

HB 3 and SB 2 cap how fast a taxing unit can raise revenue, so the foregone amount cannot be recovered by raising rates later — it is treated as a permanent reduction in local fiscal capacity, not as a per-resident charge. The separate question of the costs the project imposes on the existing budget is being quantified and is not included in the figures above.

The siting-risk index is a weighted composite: $0.35 \cdot \text{land} + 0.35 \cdot \text{permissive} + 0.30 \cdot \text{infrastructure proximity}$, normalized to $[0,1]$ across 254 counties.

What you can do

Show up. Attend every commissioners court session where data centers are on the agenda. Sign up to speak. Even three minutes of public comment per person, multiplied across thirty residents, becomes a record.

Share this briefing. The interactive map and this page are open and shareable. Send them to neighbors. Post on Nextdoor and Facebook with the link.

File TPIA requests. The Texas Public Information Act lets any citizen request records from any local body. Ask for the air-permit file, the commissioners court video, the EDC task-force materials.

Use the groundwater district. This is now the strongest citizen lever, and it is individual: any person in the Upper Trinity GCD may request a contested-case hearing on a high-volume permit application, and the district must give notice before it acts. Register your well, watch the district's hearing notices, and be ready. *The abatement fight is over — the county has already refused. The water question is live.*

Contact your elected officials. Tell them this matters. The state is collecting data on every project in the queue right now, with ERCOT working to finish by December 10, 2026 — asking that the results be published county by county is a request an ordinary constituent can make.

Sen. Phil King · TX Senate District 10 (primary for Parker) · senate.texas.gov/member.php?d=10

Sen. Brent Hagenbach · TX Senate District 30 · senate.texas.gov/member.php?d=30

Rep. Mike Olcott · TX House District 60 · 212 Santa Fe Dr., Weatherford · house.texas.gov/members/member-page/?district=60

Talk to neighbors in the other 13 counties. The Fort Worth Power Core rollout is statewide. Coordinated pushback is far stronger than one county acting alone.

Thank you. Black Mountain · Parker County · June 9, 2026.
